

The repository has moved to the team organisation

Done on 17 September. This document used to be a plan. It is now a record of what happened and a short list of what is still outstanding, which is mostly not code.

Where everything lives now

Organisation	github.com/SIH-vis, display name Aavran
Repository	github.com/SIH-vis/sih_Vtransformer
Visibility	Private
History	All 70 commits, both tags, root commit intact
Old address	vansh-attention/sih_Vtransformer, still exists, no longer the one we use

The report's appendix, this document set, `README.md`, `ONBOARDING.md` and the git remote all point at the organisation. Nothing still prints the personal address.

What was actually done

The organisation already held a repository of the same name, created on 10 September, containing one commit by Vansh with a nineteen-byte `README`. Our full history was pushed over it, and **that placeholder commit was preserved first** on a branch called `initial-placeholder`, so nothing of anyone's was destroyed. Delete that branch whenever you like; it exists only so that the move took nothing away.

The local origin now points at the organisation. The old repository is still reachable as a remote called `personal`, so nothing is stranded.

Outstanding, and one of them matters

1. The repository is private, and the report invites Ma'am to clone it

This is the one to decide first. The last page of the report gives her the address and tells her the numbers can be reproduced from it. **If she opens that link today she gets a 404**, which reads as a dead link rather than a permission setting.

Three ways out, in order of preference:

1. **Make it public.** Simplest, and the evidence is the point of the exercise. Everything in it is our own work and there is nothing sensitive: no keys, no credentials, no personal data, and the test fixtures use invented values. Settings, General, Danger Zone, Change visibility.
2. **Invite her as a collaborator.** Keeps it closed, but she needs a GitHub account and has to accept an invitation before she can read a word of it, which is friction at exactly the wrong moment.
3. **Leave it private and drop the invitation from the report.** Honest, but it gives up the strongest thing the report has, which is that every number in it can be checked.

Whoever decides, decide before the email goes out.

2. Invite the other five

People, Invite member, their GitHub usernames. Everyone gets **Write**. Make at least one more person an **Owner**, so the organisation is not locked to one account if somebody loses access before December.

3. Decide what happens to the old repository

Both copies currently hold the same history, which is fine today and will not stay fine. The moment somebody pushes to one of them they diverge, and then there are two answers to the question of what the project is.

Ask Vansh to **archive** vansh-attention/sih_vtransformer. Archiving makes it read-only and reversible, it keeps the history and the link alive for anyone who already has it, and it removes any doubt about which repository is the real one.

4. Two small things

- The organisation repository's description still reads "vision transfer problem statement of the SIH". The problem statement is about on-device visual perception with privacy preservation; the description is worth a rewrite before anybody outside reads it.
- The SIH portal **Team Name** field and deck slide 1 still carry placeholders. Rebuild the deck with `python3 deck/build.py`, then re-export the PDF from PowerPoint.

If any of it needs doing again

```
./scripts/retarget-repo.sh <org> <repo-name>
```

It checks the repository exists as **you** before touching anything, so it works for a private repository, then updates the git remote, rewrites the address in the report builder, rebuilds the PDF, and verifies the new path is in the document and the old one is gone.

Afterwards:

```
git remote -v          # origin should be the org
./test-all.sh          # 17 checks, still green
```

Then open the last page of the report and confirm the address printed there is the right one. That page is the only one a reader acts on, so a wrong URL there is worse than none.
