

Aavaran — side panel

Blank canvas. Design whatever you like on it.

Page size	800 × 1800 px already set on every page here
Why that size	the panel at 2× it is really 400 × 900, so halve everything
One rule	use even numbers odd numbers land on half a pixel in the browser

The grey dashed lines are guides, not constraints. They show where the current design puts its margins. Move them, ignore them or delete them — colour, type, spacing and mood are all yours.

One screen per page. If a screen is longer than the page, carry on to a new page and put -cont after the name.

The 13 screens, each on its own page

0-launch-screen	before the panel appears
1-idle-server-ready	the first screen anyone sees
2-server-offline	agent can't run; scan still can
3-scan-result	the screen that proves it
4-run-complete	result, then the full record
5-settings-open	server address and controls
6-scan-ambiguous-field	hidden, kind not named
7-server-unreachable-repo	how to start the server
8-scan-only-package	what the emailed zip shows
9-model-not-installed	offers a 6 GB download
10-page-unreadable	we refuse to call it clean
11-model-downloading	a progress bar
12-scan-only-but-server-up	scan-only, server answered

Sending it back: PNG of each page at 1:1, no scaling, filename = page name. Keep the page names as they are — that is how each design gets matched to the screen it belongs to.

If the import misbehaves, Canva → Custom size → 800 × 1800 px does the same job.
