

Names to discuss

Three separate things need names, and they do not have to match.

What	Where it appears	Any constraint?
Team name	SIH portal, deck slide 1, the report	None. Anything you like.
Project name	The repo, the extension, the demo	None. It sits inside your org, so it only has to be unique to you.
GitHub org	The URL in the report's appendix	Must be free on GitHub. Usually the team name.

Only the third has a real constraint, and it is the only reason "taken" appears below. A project called Chhaya can happily live at `github.com/<yourteam>/chhaya` even though `github.com/chhaya` belongs to someone else.

Project names

The project is a browser add-on that covers up private details before anything is sent to an AI. Good names point at *hiding in order to help*, not just at privacy.

Name	Meaning	Why it fits	Watch out for
Antardrishti	"inner vision" (Sanskrit); also ordinary Hindi for <i>insight</i>	The perception happens inside your machine and stays there. This is the architecture, stated in one word. Reads as a real word, not a pun.	Twelve letters; people will shorten it
Mukhauta	"mask" (Hindi)	The page puts on a mask before the AI sees it. Concrete, visual, easy to explain to anyone	Sounds playful, maybe too light for ISRO
Chhaya	"shadow, reflection" (Sanskrit/Hindi)	The server only ever sees a shadow of the real page. Short, soft, memorable	Fairly common word; less distinctive
Aavaran	"covering, veil" (Sanskrit)	Also idiomatically a <i>screen</i> or <i>sheath</i> , which is a genuine double meaning here	Less widely understood than the others
One-Way Glass	plain English	The agent sees out, nobody sees in. Anyone understands it instantly, no translation	Generic; no Indian character
Redact First	plain English	States the single design rule the whole project rests on	Sounds like a feature, not a product

My pick: Antardrishti. It is the only one where the name *is* the technical claim. "Inner vision" describes precisely where the seeing happens and why nothing escapes, and because it also means "insight" in normal speech it does not sound like a forced acronym. It will land with an ISRO jury.

Runner-up: Mukhauta, if you want something friendlier and easier to say. The mask image makes the whole idea explainable in one sentence to a non-technical person, which is worth a lot in a five-minute pitch.

Team names

A team name should say something about the six of you, not about the software. It also outlives this one project.

Name	Meaning	Note
Anveshan	"quest, investigation, research"	Fits a team whose strongest section is the one admitting what it got wrong
Paridhi	"boundary, perimeter"	Our whole design is about one boundary and what may cross it
Kshitij	"horizon"	Common in Indian student teams, which cuts both ways
Sankalp	"resolve, determination"	Warm, slightly generic
Aarambh	"beginning"	Good for a first-year team; you are batch 01 of BS-DSBM
Antardrishti	as above	Works as both, if you would rather have one name for everything

My pick: Anveshan, if you want team and project to be different. It means enquiry rather than achievement, which matches a report whose best section is about mistakes.

Simplest option: use Antardrishti for all three. One name for the team, the project and the org is easier to explain, easier to remember, and means the deck, the portal and the repo all agree. Fewer things to keep in sync under a deadline.

What is free on GitHub right now

Checked 17 September 2026. Only matters for the org.

Free: antardrishti, mukhauta, screenmask, oneway-glass, redactfirst, sih26171, antardrishti-labs

Taken: chhaya, aavaran, anveshan, paridhi, kshitij, sankalp, aarambh, silhouette, blindfold, pratibimb

If you want a taken name as your *team* name, that is completely fine. Use it on the portal and pick something else for the org, or add a suffix like anveshan-*iimm*.

Three ready-made combinations

A. One name for everything Team *Antardrishti*, project *Antardrishti*, org *antardrishti*. Simplest. Everything agrees, nothing to keep in sync.

B. Team and project distinct Team *Anveshan*, project *Antardrishti*, org *antardrishti*. The team has its own identity that survives past this hackathon.

C. Plain English throughout Team *One-Way Glass*, project *One-Way Glass*, org *oneway-glass*. No translation needed for any audience, at the cost of Indian character.

Once you decide

Tell me the org name and the repo name and it is one command:

```
./scripts/retarget-repo.sh <org> <repo-name>
```

That updates the git remote, rewrites the URL in the report, rebuilds the PDF, and verifies the new address actually resolves before it prints anything. Two things still need a person, and both are in `ORG-MIGRATION.md`: creating the organisation, which GitHub only allows through the website, and transferring the repository, which only Vansh can start because he owns it.
